

Cardiac Conditions in Obstetric Care Change Package

Authors

Kelly McCutcheon Adams, LICSW, Senior Director, IHI

Diana S. Wolfe, MD, MPH, FACOG, Faculty, IHI

Acknowledgments

The Cardiac Conditions in Obstetric Care Change Package was made possible with the generous funding of the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) under grant number UC4MC28042, Alliance for Innovation on Maternal Health (AIM). We thank Lauren Enright and Catherine Mather, MA for their contribution as members of the Institute for Healthcare Improvement (IHI) core team. We also thank our AIM colleagues, Emily Greenwood and Hannah Kaufman, for their steadfast partnership in this work, as well as our numerous expert faculty who contributed during the foundational expert meeting, interviews, and/or subsequent draft reviews: Karen Florio, DO, MPH, FACOG; Afshan Hameed, MD; Maryam Tarsa, MD; Suzanne Baird, DNP, RN; Brianna Harris-Henderson; Melinda Davis, MD, FACC; Isis Jackson; Alison Haddock, MD, FACEP; Renée Byfield, MS, RN, FNP, C-EFM; Rachel D’Souza-Siebert; and Garsy Presumey-Leblanc, MS.

These materials were developed with support from the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) as part of a cooperative agreement with the American College of Obstetricians and Gynecologists under grant number UC4MC28042, Alliance for Innovation on Maternal Health. The contents do not necessarily represent the official views of, nor an endorsement, by HRSA, HHS, or the U.S. Government. For more information, please visit [HRSA.gov](https://www.hrsa.gov)

Introduction

The Alliance for Innovation on Maternal Health (AIM) is a national data-driven maternal safety and quality improvement (QI) initiative. AIM works through state and community-based teams to align national, state, and hospital-level QI efforts to reduce preventable maternal mortality and severe morbidity across the United States.

The AIM Patient Safety Bundles are a core part of this work. To promote the successful implementation of these bundles, AIM partnered with the Institute for Healthcare Improvement (IHI) to create a series of associated change packages. This specific change package is designed to support Perinatal Quality Collaboratives (PQCs) and other state-based initiatives to leverage the AIM Cardiac Conditions in Obstetric Care Patient Safety Bundle more effectively.

Why is this important?

Cardiovascular disease (CVD) is the leading cause of maternal mortality and morbidity in the first year postpartum, and the leading indirect cause of maternal mortality, particularly in non-Hispanic Black and Hispanic birthing people.¹ Across all age groups and all causality, non-Hispanic Black women have a higher prevalence of pregnancy-related mortality than others.² Recent national data on maternal mortality by race confirms a statistically significant increase in deaths per 100,000 live births each year from 2018 to 2020. Furthermore, the rates are highest among non-Hispanic Black populations and women over the age of 40.³ A California analysis of maternal deaths due to CVD found that the majority occurred in the postpartum period.⁴

There is an urgent need to mobilize resources to care for pregnant and postpartum birthing people with known and newly diagnosed CVD. This will involve developing multidisciplinary teams consisting of specialists in maternal-fetal medicine, cardiology, and anesthesia. This safety bundle and change package will provide guidance for establishing a system to manage the complex health of these pregnant and postpartum birthing people. The goal of this safety bundle and change package is to provide recommendations with associated examples and references to facilitate pregnancy cardiovascular risk assessment, appropriate diagnostic testing, early recognition of cardiac emergencies, and creation of a cardio-obstetrics team. The focus will be on checklists, protocols, and multidisciplinary management. The emphasis is on respectful care and a multidisciplinary approach at all levels of care.

What is a change package?

A change package is a document listing evidence-based or best-practice changes specific to a topic and is usually organized around a framework or model. The Cardiac Conditions in Obstetrical Care Change Package is structured around the AIM [Cardiac Conditions in Obstetric Care Patient Safety Bundle](#).⁵

Changes packages are structured around the following components:

- **Primary Drivers:** Major processes, operating rules, or structures that will contribute to moving toward the aim. In this change package, the primary drivers are based on AIM's Five Rs Framework (Readiness, Recognition & Prevention, Response, Reporting/Systems Learning, and Respectful Care).
- **Change Concepts:** Broad concepts (e.g., "move steps in the process closer together") that are not yet specific enough to be actionable but that will be used to generate specific ideas for change.
- **Change Ideas:** Actionable, specific idea for changing a process. Change ideas can come from research, best practices, or from other organizations that have recognized a problem and have demonstrated improvement on a specific issue related to that problem.

Taken as a whole, a change package has the potential to seem overwhelming. Based on the priorities of your state and community, we encourage you to start small by testing a couple of ideas connected to the aim you set. Through iterative tests of change (also known as Plan-Do-Study-Act (PDSA) cycles), you will have an opportunity to learn what works and what does not in your efforts to improve your processes. Initially, these cycles are carried out on a small scale (e.g., one patient on one day) to see if they result in improvement. Teams can then expand the tests and gradually incorporate larger and larger samples until they are confident that the changes will result in sustained improvement.

How to prioritize changes?

No team is expected to test all the listed change ideas. Consider this a menu of options from which you may choose what to tackle first. Each team will review their baseline data, progress to date, organizational priorities, and select an area(s) to prioritize. For example, some may start with one driver. Others may start by tackling one idea across all drivers. Start by choosing an area that you think could lead to an easy win.

You can also leverage the following tools to help you decide where to start:

1. [Pareto chart](#): A type of bar chart in which the various factors that contribute to an overall effect are arranged in order according to the magnitude of their effect. This ordering helps identify the "vital few" – the factors that warrant the most attention.⁶
2. [Priority matrix](#): A tool that can better help you to understand important relationships between two groupings (e.g., steps in a process and departments that conduct that step) and make decisions on where to focus.⁷
3. [Impact-effort matrix](#): A tool that helps identify which ideas seem easiest to achieve (least effort) with the most effects (highest impact). The ideas identified via this tool would be a great place to start.⁸

Change Package

A Note on Symbols

Respectful, Equitable, and Supportive Care

In addition to having an independent section in this change package dedicated to the AIM Cardiac Conditions in Obstetric Care Patient Safety Bundle's fifth R (Respectful, Equitable, and Supportive Care), all change ideas in other sections that fall under this R are marked with a  symbol.

Additional Considerations

It is understood that every team utilizing this change package will be at a different point in this work. If your organization is further along in your obstetrical cardiac conditions improvement work and has found reliability in some of the change ideas below, we suggest testing the additional considerations that are in *italics* and marked by the * symbol.

Readiness

Every Unit/Team

Change Concept	Change Idea	Key Resources and Tools
<p>Train all obstetric (OB) providers to perform a basic Cardiac Conditions Screen</p>	<p>Determine which screening tool will be used and train providers to use it</p> <p><i>A cardiac conditions screening tool should include: *</i></p> <ul style="list-style-type: none"> • <i>Patient history of cardiac conditions</i> • <i>Patient-reported symptoms</i> • <i>Vital signs</i> • <i>Physical examination</i> 	<p>California Maternal Quality Care Collaborative (CMQCC): Improving Health Care Response to Cardiovascular Disease in Pregnancy and Postpartum⁹</p> <p>California Cardiovascular Screening Tool: Findings from Initial Implementation¹⁰</p> <p>Screening for Cardiovascular Disease in Pregnancy: Is There a Need?¹¹</p>
