Postpartum Discharge Transition Change Package
Authors

Patricia Lee King, PHD, MSW, Faculty, IHI
Deborah Bamel, MPH, Director, IHI
Kelly McCutcheon Adams, LICSW, Senior Director, IHI

Acknowledgments

The Postpartum Discharge Transition Change Package was made possible with the generous funding of the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) under grant number UC4MC28042, Alliance for Innovation on Maternal Health (AIM). We thank Catherine Mather, MA and Lauren Enright for their contributions as members of the Institute for Healthcare Improvement (IHI) core team. We also thank our AIM colleagues, Emily Greenwood and Hannah Kaufman, for their steadfast partnership in this work, as well as our numerous expert faculty who contributed during the foundational expert meeting, interviews, and/or subsequent draft reviews: Julie Blumenfeld, DNP, CNM, IBCLC; Miasha Gilliam-El, RN; Kimberly Harper, MSN, RN, MHA; Robena Hill; Jessica Irrobali, MSN, RNC-OB, C-ONQS, C-EFM; Sue Kendig, JD, WHNP-BC, FAANP; Starlita Kilpatrick; Tiffany Moore-Simas, MD, MPH, MEd, FACOG; Patricia Suplee, PhD, RNC-OB, FAAN; Kristin Tully, PhD; and Lynn Yee, MD, MPH.

These materials were developed with support from the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) as part of a cooperative agreement with the American College of Obstetricians and Gynecologists under grant number UC4MC28042, Alliance for Innovation on Maternal Health. The contents do not necessarily represent the official views of, nor an endorsement by, HRSA, HHS, or the U.S. Government. For more information, please visit HRSA.gov

Introduction

The Alliance for Innovation on Maternal Health (AIM) is a national data-driven maternal safety and quality improvement (QI) initiative. AIM works through state and community-based teams to align national, state, and hospital-level QI efforts to reduce preventable maternal mortality and severe morbidity across the United States.

The AIM Patient Safety Bundles are a core part of this work. To promote the successful implementation of these bundles, AIM partnered with the Institute for Healthcare Improvement (IHI) to create a series of associated change packages. This specific change package is designed to support Perinatal Quality Collaboratives (PQCs) and other state-based initiatives to leverage the AIM Postpartum Discharge Transition Patient Safety Bundle more effectively.

Why is this important?

Maternal mortality in the United States is far higher than in other developed nations, and it continues to rise.\textsuperscript{1,2} In addition, significant racial disparities in health outcomes exist for pregnant and postpartum patients.\textsuperscript{2} More than 50 percent of pregnancy-related deaths occur one week to one year after pregnancy, and more than 80 percent of pregnancy-related deaths are deemed preventable.\textsuperscript{3} Currently, up to 40 percent of birthing people do not attend a routine postpartum visit, and few receive all recommended elements of postpartum care.\textsuperscript{4}

The postpartum period provides an important opportunity to support birthing persons and their families, as it is often a time of increased patient motivation, engagement, and access to insurance. Intervention in the postpartum period can contribute to long-lasting maternal health and family benefits. It is therefore critical to ensure that birthing persons receive comprehensive care and support during the postpartum period.

Optimal postpartum care should be an ongoing process with, at minimum, three- and 12-week postpartum visits. Care during the postpartum period should include screening for mood and substance use disorders, diabetes and cardiovascular disease, and cancer. Additional elements of optimal postpartum care include screening for social determinants of health and linkage to specialty care and services; management of pregnancy-specific health conditions; anticipatory guidance addressing the transition to parenthood and well-woman care; comprehensive contraceptive counselling; interpregnancy and preconception counseling; and immunizations.

This change package aims to aid teams implementing the AIM Postpartum Discharge Transition Patient Safety Bundle by preparing their institution to facilitate postpartum care transitions; recognize immediate care needs to prevent severe maternal morbidity and maternal mortality; and ensure timely and effective responses to postpartum complications and concerns. In addition, this change package lays the foundation for respectful, equitable, and supportive care for all during the postpartum period.
What is a change package?

A change package is a document listing evidence-based or best-practice changes specific to a topic and is usually organized around a framework or model. In this case, the Postpartum Discharge Transition Change Package is structured around the Postpartum Discharge Transition Patient Safety Bundle.5

Changes packages, including this one, are structured around the following components:

- **Primary Drivers**: Major processes, operating rules, or structures that will contribute to moving toward the aim. In this change package, the primary drivers are based on AIM’s Five Rs Framework (Readiness, Recognition & Prevention, Response, Reporting/Systems Learning, and Respectful Care).

- **Change Concepts**: Broad concepts (e.g., “move steps in the process closer together”) that are not yet specific enough to be actionable but that will be used to generate specific ideas for change.

- **Change Ideas**: Actionable, specific ideas for changing a process. Change ideas can come from research, best practices, or from other organizations that have recognized a problem and have demonstrated improvement on a specific issue related to that problem.

Taken as a whole, a change package has the potential to seem overwhelming. Based on the priorities of your state and community, we encourage you to start small by testing a couple of ideas connected to the aim you set. Through iterative tests of change (also known as Plan-Do-Study-Act (PDSA) cycles), you will have an opportunity to learn what works and what does not in your efforts to improve your processes. Initially, these cycles are carried out on a small scale (e.g., one patient on one day) to see if they result in improvement. Teams can then expand the tests and gradually incorporate larger and larger samples until they are confident that the changes will result in sustained improvement.
How to prioritize changes?

No team is expected to test all the listed change ideas. Consider this a menu of options from which you may choose what to tackle first. Each team will review their baseline data, progress to date, organizational priorities, and select an area(s) to prioritize. For example, some may start with one driver. Others may start by tackling one idea across all drivers. Start by choosing an area that you think could lead to an easy win.

You can also leverage the following tools to help you decide where to start:

1. **Pareto chart**: A type of bar chart in which the various factors that contribute to an overall effect are arranged in order according to the magnitude of their effect. This ordering helps identify the "vital few" — the factors that warrant the most attention.  

2. **Priority matrix**: A tool that can better help you to understand important relationships between two groupings (e.g., steps in a process and departments that conduct those steps) and make decisions on where to focus.

3. **Impact-effort matrix**: A tool that helps identify which ideas seem easiest to achieve (least effort) with the most effects (highest impact). The ideas identified via this tool would be a great place to start.
Change Package

A Note on Symbols

Respectful, Equitable, and Supportive Care
In the latest revision of the AIM Postpartum Discharge Transition Patient Safety Bundle, a fifth R was added; Respectful, Equitable, and Supportive Care. This R is integrated throughout the change package, and all change ideas that fall under this R are marked with a ◊ symbol.

Additional Considerations
It is understood that every team utilizing this change package will be at a different point in this work. If your organization is further along in your postpartum discharge transition improvement work and has found reliability in some of the change ideas below, we suggest testing the additional considerations in *italics* and marked by the * symbol.

### Provide each postpartum patient with a standardized discharge summary form that details key information from pregnancy and birth

Use a standard template for patient-facing discharge summaries and include a 1/2-page summary at the top with critical information such as health system contact information and resources for safety and wellness.

Create digital and paper versions of discharge summaries to share information more easily with patients and across providers and facilities. Ensure that patients receive information on how to access the information electronically as part of discharge education.

Ensure that any pregnancy or delivery complications and postpartum risk factors are listed clearly on a patient-facing discharge summary (e.g., on the first page, bolded) and called out clearly in the EHR.

### Conduct a comprehensive postpartum visit

Consider timing of postpartum visit(s) and test models for more frequent touchpoints, such as a 2-3-week visit followed by a 6-8-week visit.

Schedule the postpartum visit for at least 30 minutes.

Create a checklist for standard screening to take place at the postpartum visit, including mental health and postpartum depression screening as well as screening for SDoH-related needs.

| Include each pregnant or postpartum person and their identified support network as respected members of and contributors to the multidisciplinary care team | Engage patients and their caregivers in decision making about their care at every point from admission through discharge, including during rounds◊  
Provide tools and scripts for providers to use for shared decision-making conversations◊*  
Facilitate open conversations to ensure that patient concerns are adequately addressed, and investigate possible causes when patients express that something is "off." Consider ways in which implicit bias and structural racism may influence response to patient concerns and response to pain◊  
Make an organizational policy and train teams to use an antiracism, birth equity, and social justice lens◊*  
Ask patients if they would like to be accompanied by their support person for any exams, procedures, and discussions◊  
Create and use wall signage to inform patients that they can be accompanied by their support person for any exams, procedures, and discussions about their care◊*  
Provide funded opportunities for patients and families to engage in process improvement in inpatient and outpatient settings, and to co-design tools and resources◊ | AHRQ: The SHARE Approach: 5 Essential Steps of Shared Decision Making\textsuperscript{125}
